

Issued: 16/05/19

IN BRIEF

- Yellow water pan traps now showing winged aphid numbers are increasing but results vary across regions.
- Winged aphid numbers are greatest in the west of the beet growing area e.g. Cambridgeshire.
- Count aphids on 10 plants across the field each week. If the threshold of 1 green wingless aphid per 4 plants up to the 12-leaf stage is reached, then treatment is justified.
- Virus has been detected in 12 aphids, of those tested to date. This represents less than one percent of the population carrying virus and in line with the long-term average. However, aphicides should be applied against the green wingless aphid threshold, these virus data are supplementary.
- Look for aphids on heart leaves, within folds at leaf margins, and on underside of leaves.
- Apply aphicide based on the number of green wingless aphids in your crop. **It is important you reach the aphid threshold** before application.
- Regularly check the BBRO's virus yellows map to see yellow water pan traps near you. Visit https://bbro.co.uk/on-farm_aphid survey.
- Sporadic, occasionally severe, damage due to flea beetle and thrips has been recorded.
- Use the BBRO Plant Clinic if you require clarification or wish to have a sample analysed.
- Don't forget to check farm for beet clamp spoil, ensure you spray off and destroy any regrowth.
